

How to add new field at Sign up Page with encrypted model ?

-You should have basic knowledge of PHP Codeigniter framework and MySQL database. Basic means

1. How models, controllers, views folder are integrated with each other
2. How Libraries, Helper folder works.

let's add Address field to our script.

1. Open application/view/default/home/signup.php

=> you can add

```
<div class="fill_item">
    <div class="login-label">Address:</div>
    <div class="login-fild">
        <input type="text" name="address" id=" address " value=""
class="btn_input">
    </div>
```

```
<div class="clear"></div>
```

```
</div>
```

2. add address field to user table of your database
3. Open application/controllers/home.php, Go to signup() function.

You can see below code at line 2338

you can see \$user_data array variable ,

just add 'address'=>SecurePostData(\$this->input->post('address')) to your array variable.

this way you can add any number of fields.

OR

we are using address table with column id pk, user_id, address

let's add Address field to our script.

1. Open application/view/default/home/signup.php

=> you can add

```
<div class="fill_item">
    <div class="login-label">Address:</div>
```

```

        <div class="login-fild">
            <input type="text" name="address" id=" address " value=""
class="btn_input">
        </div>

        <div class="clear"></div>

    </div>

```

2. For any new feature or functionality you can create new model file like class Address_model extends ROCKERS_Model

```

{

function Address_model()
{
    parent::__construct();
}
//save data
function saveaddress($array_data=array())
{

    if(is_array($array_data))
    {
        //if data should be update
        if(is_numeric($array_step1['id']))
        {
            $this->db->where('id',$array_data['id']);
            $this->db->update('address',$array_data);
            $address_id=$array_data['id'];
        }
        else
        {
            $this->db->insert('address',$array_data);
            $address_id=mysql_insert_id();
        }

        return $address_id;
    }
}

```

```
}
```

```
}
```

3.

3. Open application/controllers/home.php, Go to signup() function.

You can see below code at line 2338

you can see \$user_data array variable ,after this array code.

first load \$this->load->model('address_model') .

define your array with data like

```
$user_id =$sign; //this variable has user_id
```

```
$user_data=array('user_id'==>$user_id, 'address'=>SecurePostData($this->input->post('address')))
```

```
call your new model function $sign=$this->address_model-> saveaddress ($user_data);
```

it will save your address field data in new table address.
